COVID-19 was officially declared a pandemic in March 2020 by the World Health Organisation (2020) and has changed the way we live and work, causing a cascade of political, economic and social breakdowns (Kisner, 2021). The pandemic has shone a light on gender inequalities in unpaid labour in Mexico with women being expected to be responsible for increased household chores, childcare, assisting their children with online classes, as well as caring for the elderly and family members sick with COVID-19 (Manrique De Lara & De Jesús Medina Arellano, 2020; Observatorio de Género y COVID-19, 2021). In particular, the unpaid care work involved in caring for elderly family members in Mexico is an important issue, especially since research indicates that the number of dependent older adults in Mexico is more than 2 million people (around 2% of the population) and if demographic trends remain the same, this number could rise to more than 8 million by 2050 (Aranco et al., 2018; Ortega & Aranco, 2019). Despite this, unpaid care work and domestic labour, which involves caring for children, elderly or sick family members and the general maintenance of the household are greatly underestimated in society and often exploited.

Globally, more than 75% of unpaid care and domestic work is done by women and young girls (International Labour Office, 2018), and in Mexico, this statistic is 74.3% (Charmes, 2019). Before the pandemic, women in Mexico dedicated an average of 29 hours a week to unpaid care work and domestic labour, whilst men only dedicated 9.2 hours a week (Charmes, 2019). It is safe to assume that this number has gone up significantly since the pandemic. Recent research also shows that globally, young girls spend significantly more hours on household chores compared to boys, and school closures during the COVID-19 pandemics means that now young girls are taking on more chores at home (United Nations, 2020).

In Mexico, unpaid care work and domestic labour have been historically and culturally assigned to women (Amilpas García, 2020) and women are often expected to care for children and elderly relatives without any recognition or payment. Research shows that the impact of this type of unpaid labour is enormous and compensates for a lack of public expenditure on care services and infrastructure (International Labour Office, 2018). However, the domestic labour of women is ignored in society and instead, women's empowerment is measured by their presence in the workplace, which is attained by outsourcing housework and childcare to others, usually women of lower socioeconomic status (Kisner, 2021). The devaluation of domestic labour in the home is not accidental as this devaluation further entrenches the patriarchal ideas underpinning many societies. Additionally, the inequitable division of unpaid care work, with the majority of the burden falling to women, is aligned with socially constructed gender norms that define women as "nurturing, self-sacrificing, and caring- and men as breadwinners" (King et al., 2020, p. 80).

The unequal distribution of unpaid care work also represents a barrier to women as it hinders their participation in the workforce and limits their ability to support themselves, especially now during the COVID-19 pandemic (International Labour Office, 2018; King et al., 2020; Sullivan, 2019). For example, in 2020, 2.3 million women in the U.S. dropped out of the workforce, often to care for their children as schools closed due to the pandemic (Kisner, 2021). During this crisis, women are more likely to withdraw from the workforce if their workplace does not offer flexible hours or they do not have support from their partner or family members.

These revelations surrounding the gender inequalities of the pandemic have given rise to more research on the matter. Xue and McMunn's (2021) recent quantitative study on gender differences in unpaid care work and psychological distress during the UK Covid-19 lockdown, using a nationally representative sample from the UK, found that women spent more time on unpaid care work than men during the Coronavirus pandemic and that it was more likely to be the mother than the father who reduced her working hours to increase time on childcare and assist with online classes. As a result, the women in the study were more likely to report increased levels of psychological distress (Xue & McMunn, 2021). This study is just one example of the research being done on this issue. A substantial amount of literature and research has been published recently on the inequitable gendered impacts of COVID - 19 in different countries, such as South Africa (Parry & Gordon, 2021), the US (Bahn et al., 2020; Raile et al., 2020), Israel (Kristal & Yaish, 2020), Germany (Czymara et al., 2021; Power, 2020), the UK (Fisher & Ryan, 2021; Orefice & Quintana-Domeque, 2021; Xue & McMunn, 2021), Spain (Farre et al., 2020), the European region (Cook & Grimshaw, 2021), Vietnam (Dang & Viet Nguyen, 2021), and Mexico (Amilpas García, 2020; Manrique De Lara & De Jesús Medina Arellano, 2020). However, more research should be encouraged in this field, especially in Mexico.

The COVID-19 pandemic has made it apparent that the world's formal economy and the maintenance of our daily lives are built on the invisible and unpaid labour of women and young girls (United Nations, 2020). The value of women's paid and unpaid labour is becoming increasingly apparent as schools have closed and parents are scrambling to care for their children and other family members whilst maintaining their full-time jobs (Bahn et al., 2020). At the same time, workers who are deemed essential and cannot telecommute are forced to go to work and put themselves and subsequently their families at risk of infection. The COVID-19 crisis has also intensified the care needs of older persons and ill family members, with women often being expected to care for family members sick with COVID-19. The truth is that the unpaid care work and domestic labour performed by women is critical for sustaining our society and policies need to take this into account (United Nations, 2020).

It is evident that the pandemic is deepening pre-existing gender inequalities. As researchers and women, we must begin to contemplate the inequitable gendered impacts of COVID - 19 and think of a way forward. This begins first by acknowledging the valuable contributions of women during this pandemic and then pushing for structural change. Moving forward, new economic policy should be constructed within a broader, feminist framework of human wellbeing and justice (Bahn et al., 2020). There needs to be a transformation of gendered economic discriminations, especially surrounding the inequities of unpaid care work and domestic labour (United Nations, 2020). Specifically, in the case of COVID-19 related policies, women should have equal representation and participation (United Nations, 2020), and countries need to recognise that unpaid care work and domestic labour are important pillars of society. Furthermore, countries, such as Mexico need to develop national care strategies that reduce the burden of care work on women (Observatorio de Género y COVID-19, 2021) and public policies that support work-life balance should be adopted (Amilpas García, 2020).
